

18-345: Introduction to Telecommunication Networks

Lectures 2: Protocol Stack

Peter Steenkiste

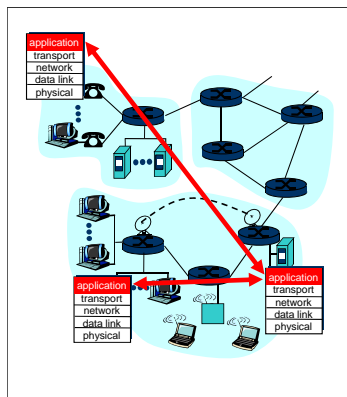

Spring 2015
www.cs.cmu.edu/~prs/nets-ece

Today's Lecture

- Network applications
 - Requirements
 - Latency and bandwidth
- Internet architecture
 - Protocols
 - A layered design
 - Life of a packet
- Network utilities

Applications and Application Protocols

- **Application: communicating, distributed processes**
 - Running in network hosts in "user space"
 - Exchange messages to implement app
 - e.g., email, file transfer, the Web
- **Application protocols**
 - One "piece" of an app
 - Define messages exchanged by apps and actions taken
 - User services provided by lower layer protocols

Client-Server Paradigm

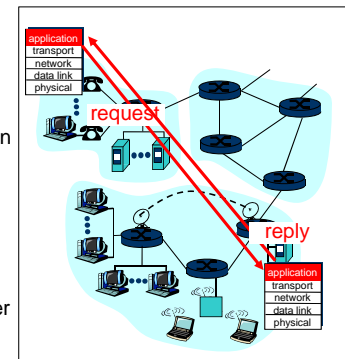

Typical network app has two pieces: *client* and *server*

Client:

- Initiates contact with server ("speaks first")
- Typically requests service from server,
- For Web, client is implemented in browser; for e-mail, in mail reader

Server:

- Provides a service to client
- e.g., Web server sends requested Web page, mail server delivers e-mail

Yesterday's Applications

- FTP: transfer files to a host
 - No distributed file systems!
 - Mostly replaced by “the web” – http
- Telnet: use a computer remotely
 - Similar to ssh today (minus the security)
- Mail: exchange electronic e-mail
 - Similar today (kind of)
 - Initially host-to-host: name@my.computer.edu
- Already very useful!

FTP: The File Transfer Protocol

- Transfer file to/from remote host
- Client/server model that allows a host (client) to transfer a file to/from another host (server)
- Application is a minimal wrapper - a command line “user interface”
 - All the heavy lifting is done in the protocol implementation
- Project: will learn about HTTP
 - Same idea but much richer functionality

FTP: Separate Control, Data Connections

- Ftp client contacts ftp server at port 21, specifying TCP as transport protocol
- Two parallel TCP connections opened:
 - **Control:** exchange commands, responses between client, server.
“out of band control”
 - **Data:** file data to/from server
- Ftp server maintains “state”: current directory, earlier authentication

Ftp Commands, Responses

Sample Commands:

- sent as ASCII text over control channel
- USER *username*
- PASS *password*
- LIST return list of files in current directory
- RETR *filename* retrieves (gets) file
- STOR *filename* stores (puts) file onto remote host

Sample Return Codes

- status code and phrase
- 331 Username OK, password required
- 125 data connection already open; transfer starting
- 425 Can't open data connection
- 452 Error writing file

Today's Applications

- Amazon, Facebook, etc.
 - What matters most?
 - 2009 quote: "*Amazon* found every 100ms of *latency* cost them 1% in sales"
- Video streaming
 - Accounts for very high percentage of bandwidth
 - Interactive versus broadcast versus playback
 - What matters most?
- Skype audio and video conferencing
 - Traditional telephone app
 - What matters most?

Requirements

- Performance: latency and throughput
- Network reliability
 - Network service must always be available
- Security: for users and the network itself
 - Privacy, authentication, deal with various attacks, ...
 - Attacks on the network, versus enabled by the network
- Scalability.
 - Scale to large numbers of users, traffic flows, ...
- Manageability: monitoring, enforcing policies, billing, ...

What Service Does an Application Need?

Data loss

Timing

Bandwidth

Transport Service Requirements of Common Apps

Application	Data loss	Bandwidth	Time Sensitive
file transfer	no loss	elastic	no
e-mail	no loss	elastic	no
web documents	no loss	elastic	no
real-time audio/ video	loss-tolerant	audio: 5Kb-1Mb video: 10Kb-5Mb	yes, 100's msec
stored audio/video	loss-tolerant	same as above	yes, few secs
interactive games	loss-tolerant	few Kbps	yes, 100's msec
financial apps	no loss	elastic	yes and no

A Closer Look at Packet Delay

When does cut-through matter?

Next: Routers have finite speed (processing delay)

Routers may buffer packets (queueing delay)

Packet Delay Components

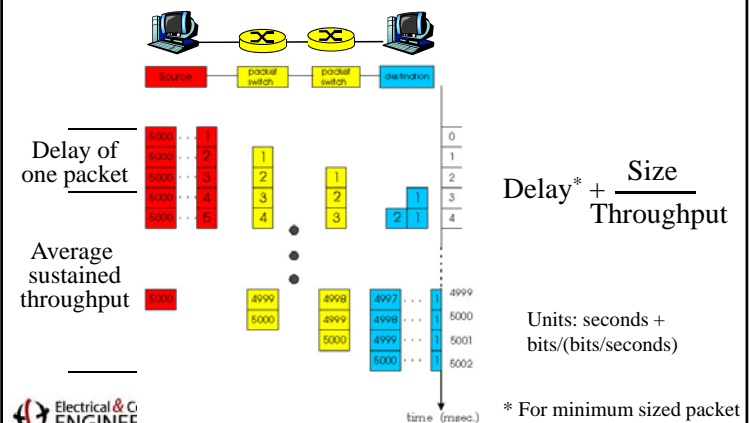

- Sum of a number of different delay components.
- Propagation delay on each link.
 - Proportional to the length of the link
- Transmission delay on each link.
 - Proportional to the packet size and 1/link speed
- Processing delay on each router.
 - Depends on the speed of the router
- Queuing delay on each router.
 - Depends on the traffic load and queue size

A Word about Units

- What do “Kilo” and “Mega” mean?
 - Depends on context
- Storage works in powers of two.
 - 1 Byte = 8 bits
 - 1 KByte = 1024 Bytes
 - 1 MByte = 1024 Kbytes
- Networks work in decimal units.
 - Network hardware sends bits, not Bytes
 - 1 Kbps = 1000 bits per second
 - To avoid confusion, use 1 Kbit/second
- Why? Historical: CS versus ECE.

Application-level Delay

Some Examples

- How long does it take to send a 100 Kbit file?
 - Assume a perfect world
- Is the transfer latency or throughput limited?
- What about a 10 Kbit file?

Throughput Latency	100 Kbit/s	1 Mbit/s	100 Mbit/s
500 μ sec			
10 msec			
100 msec			

A Closer Look at Throughput

- When streaming packets, the network works like a pipeline.
 - All links forward different packets in parallel
- Throughput is determined by the slowest stage.
 - Called the bottleneck link
- Does not matter why the link is slow!
 - Low link bandwidth
 - Many users sharing the link bandwidth

Bandwidth Sharing

- Bandwidth received on the bottleneck link determines end-to-end throughput.
- Router before the bottleneck link decides how much bandwidth each user gets.
 - Users that try to send at a higher rate will see packet loss
- User bandwidth can fluctuate quickly as flows are added or end, or as flows change their transmit rate.

Fair Sharing of Bandwidth

- All else being equal, fair means that users get equal treatment.
 - Sounds fair
- When things are not equal, we need a policy that determines who gets how much bandwidth.
 - Users who pay more get more bandwidth
 - Users with a higher "rank" get more bandwidth
 - Certain classes of applications get priority

But It is Not that Simple

Today's Lecture

- Network applications
 - Requirements
 - Latency and bandwidth
- **Internet architecture**
 - **Protocols**
 - **A layered design**
 - **Life of a packet**
- Network utilities

Lots of Protocols (and Acronyms!)

- IP: Internet protocol
- UDP: User datagram protocol
- TCP: Transmission control protocol
- FTP: File transfer protocol
- SMTP: Simple mail transfer protocol
- HTTP: Hypertext transfer protocol
- ARP: Address resolution protocol
- BGP: Border gateway protocol
- ICMP: Internet control message protocol
- DHCP: Dynamic host configuration protocol
- And many more ...

What are Protocols?

- An agreement between parties on how communication should take place
- Module in layered structure
- Protocols define: Interface to peer (syntax & semantics)
 - Actions taken on receipt of a messages
 - Format and order of messages
 - Error handling, termination, ordering of requests, etc.
- Example: Buying airline ticket

How to Design a Network?

- Has many users
- Offers diverse services
- Mixes very diverse technologies
- Components built by many companies
- Diverse ownership
- Can evolve over time

Solution #1

Solution #2?

Solution #3

Types of Protocols

- Core network: responsible for transferring data between a sending and receiving host.
- End-to-end protocols: present a network service to applications and users.
 - May add value to the core network protocols
- Driven by differences in constraints: scalability, power, management, speed, etc.

Protocol and Service Levels

A Layer Network Model

The Open Systems Interconnection (OSI) Model

Layering Characteristics

- Each layer relies on services from layer below and exports services to layer above
- Interface defines interaction with peer on other hosts – called protocols
- Modules hide implementation - layers can change without disturbing other layers (black box)

OSI Model: 7 Protocol Layers

- Physical: how to transmit bits
 - Data link: how to transmit frames
 - Network: how to route packets
 - Transport: how to send packets end2end
 - Session: how to tie flows together
 - Presentation: byte ordering, security
 - Application: everything else
- TCP/IP has been amazingly successful, and it is not based on a rigid OSI model. The OSI model has been very successful at shaping thought

Different Sources of Components

- Application: web server/browser, mail, distributed game,...
- Presentation/session
 - Often part of application
- Transport/network
 - Typically part of the operating system
- Datalink
 - Often written by vendor of the network interface hardware
- Physical
 - Hardware: card and link

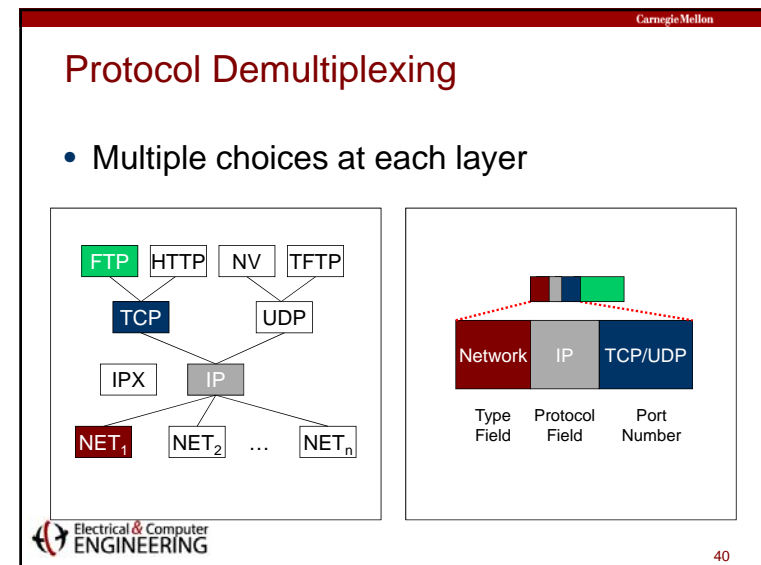

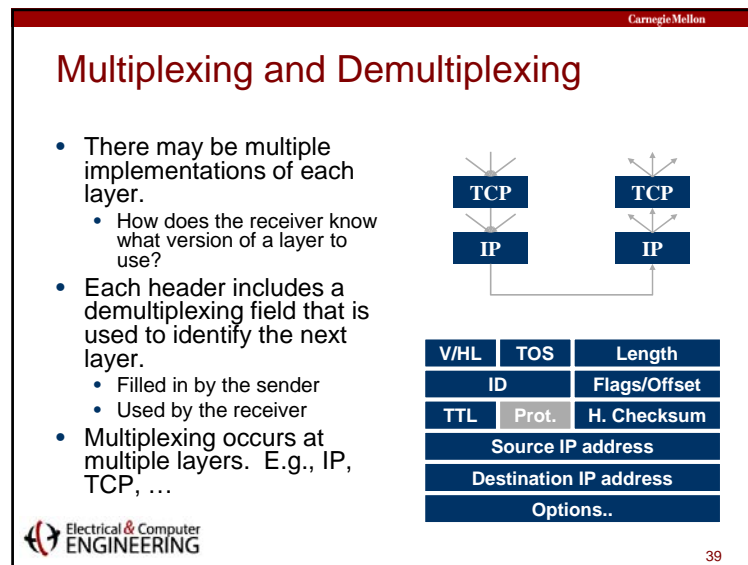

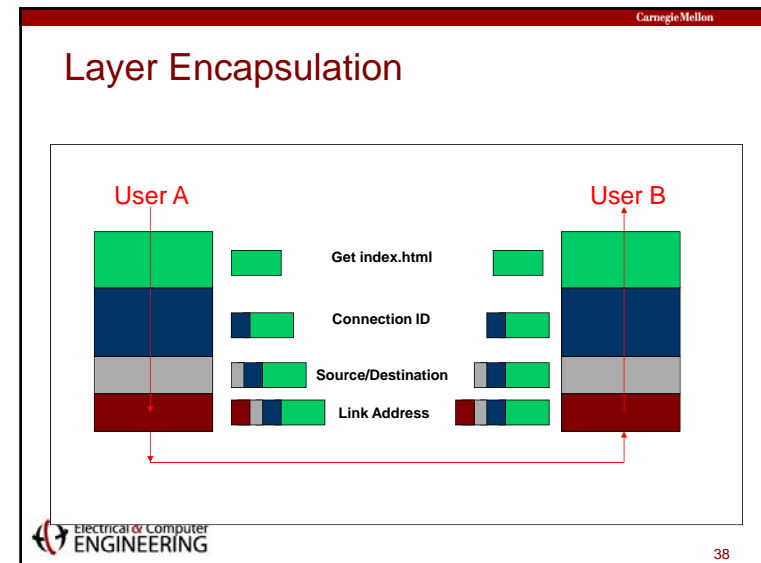

Application & Upper Layers

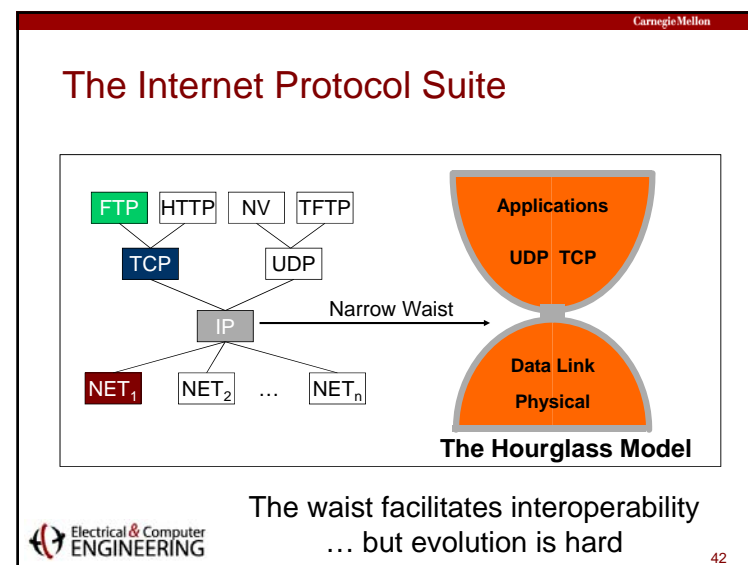

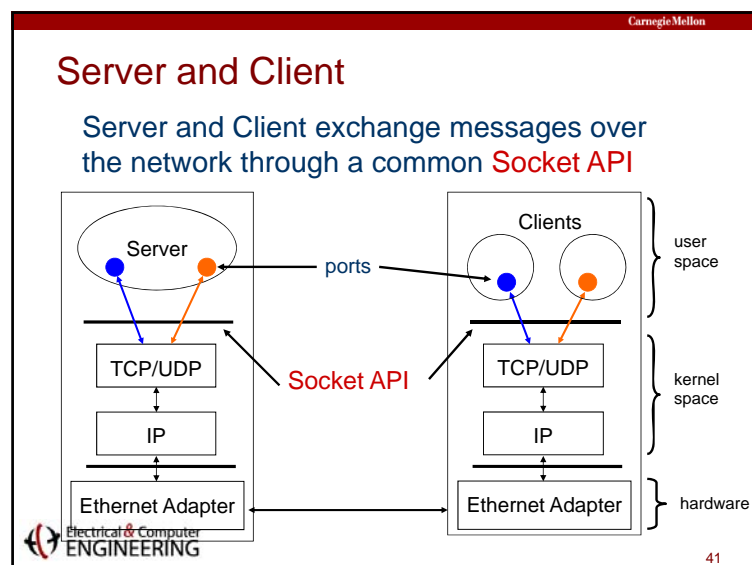

- Application Layer: Provides services that are frequently required by applications: DNS, web access, file transfer, email...
 - Presentation Layer: machine-independent representation of data...
 - Session Layer: dialog management, recovery from errors, ...
- Mostly incorporated into Application Layer**

The Internet Engineering Task Force

- Standardization is key to network interoperability
 - The hardware/software of communicating parties are often not built by the same vendor → yet they can communicate because they use the same protocol
- Internet Engineering Task Force
 - Based on working groups that focus on specific issues
- Request for Comments
 - Document that provides information or defines standard
 - Requests feedback from the community
 - Can be "promoted" to standard under certain conditions
 - consensus in the committee
 - interoperating implementations
 - Project 1 will look at the Internet Relay Chat (IRC) RFC

- Carnegie Mellon
- ## IP based on a Minimalist Approach
- Dumb network
 - IP provide minimal functionalities to support connectivity
 - Addressing, forwarding, routing
 - Smart end system
 - Transport layer or application performs more sophisticated functionalities
 - Flow control, error control, congestion control
 - Advantages
 - Accommodate heterogeneous technologies (Ethernet, modem, satellite, wireless)
 - Support diverse applications (telnet, ftp, Web, X windows)
 - Decentralized network administration
- The Carnegie Mellon logo and 'Electrical & Computer ENGINEERING' are at the bottom left, and the number '44' is at the bottom right.

- Carnegie Mellon
- ## Today's Lecture
- Network applications
 - Requirements
 - Latency and bandwidth
 - Internet architecture
 - A layered design
 - Protocols
 - Life of a packet
 - **Network utilities**
- The Carnegie Mellon logo and 'Electrical & Computer ENGINEERING' are at the bottom left, and the number '45' is at the bottom right.

Network tools

- **ping**
- **tracert**
- **ipconfig**
- **tcpdump**
- ...

ping

- Application to determine if host is reachable
- Based on Internet Control Message Protocol
 - ICMP informs source host about errors encountered in IP packet processing by routers or by destination host
 - ICMP Echo message requests reply from destination host
- PING sends echo message & sequence #
- Determines reachability & round-trip delay
- Sometimes disabled for security reasons

tracert

- Find route from local host to a remote host
- Time-to-Live (TTL)
 - IP packets have TTL field that specifies maximum # hops traversed before packet discarded
 - Each router decrements TTL by 1
 - When TTL reaches 0 packet is discarded
- Traceroute
 - Send UDP to remote host with TTL=1
 - First router will reply ICMP Time Exceeded Message
 - Send UDP to remote host with TTL=2, ...
 - Each step reveals next router in path to remote host
- **tracert** (windows), **tracepath** (linux)

ipconfig

- Utility in Microsoft Windows to display TCP/IP information about a host
- Many options
 - Simplest: IP address, subnet mask, default gateway for the host
 - Information about each IP interface of a host
 - DNS hostname, IP addresses of DNS servers, physical address of network card, IP address, ...
 - Renew IP address from DHCP server

netstat

- Queries a host about TCP/IP network status
- Status of network drivers & their interface cards
 - #packets in, #packets out, errored packets, ...
- State of routing table in host
- TCP/IP active server processes
- TCP active connections

tcpdump and Network Protocol Analyzers

- tcpdump program captures IP packets on a network interface (usually Ethernet NIC)
- Filtering used to select packets of interest
- Packets & higher-layer messages can be displayed and analyzed
- tcpdump basis for many network protocol analyzers for troubleshooting networks
- We use the open source Ethereal analyzer to generate examples (or Wireshark, etc.)
 - www.ethereal.com

How the layers work together: Network Analyzer Example

- User clicks on <http://www.nytimes.com/>
- Ethereal network analyzer captures all frames observed by its Ethernet NIC (or Wireshark)
- Sequence of frames and contents of frame can be examined in detail down to individual bytes

The screenshot shows the Ethereal network analyzer interface. The top pane displays a list of captured packets. The middle pane shows the detailed view of the selected packet (Frame 1), illustrating the encapsulation layers: Ethernet II, Internet Protocol, User Datagram Protocol, and Domain Name System (query). The bottom pane shows the raw data in hexadecimal and ASCII text.

Top Pane shows frame/packet sequence

Middle Pane shows encapsulation for a given frame

Bottom Pane shows hex & text

No.	Time	Source	Destination	Protocol	Info
1	0.000000	128.100.100.128	128.100.100.128	DNS	Standard query request to 128.100.100.128
2	0.129976	128.100.100.128	128.100.11.13	DNS	Standard query response from 128.100.11.13
3	0.131524	128.100.11.13	64.15.247.200	TCP	1127 > http [SYN] Seq=1396200325 Ack=0 win=16384 Len=0
4	0.168286	64.15.247.200	128.100.11.13	TCP	1127 > 1127 [SYN] Seq=1396200325 Ack=3638689753 win=0
5	0.168320	128.100.11.13	64.15.247.200	TCP	1127 > http [ACK] Seq=1396200325 Ack=3638689753 win=17
6	0.168688	128.100.11.13	64.15.247.200	HTTP	GET / HTTP/1.1

```

Top pane: frame

DNS Query

TCP Connection Setup

HTTP Request & Response

The top pane of Wireshark displays a list of captured packets. The first three packets are highlighted with red boxes and labels: a DNS query (No. 1), a TCP connection setup (No. 2), and an HTTP request (No. 3). The packet details pane below shows the structure of the selected packet, including Ethernet II, Internet Protocol, and Hypertext Transfer Protocol layers.

Middle pane: Encapsulation

Ethernet Frame

Ethernet Destination and Source Addresses

Protocol Type

The middle pane of Wireshark shows the encapsulation details of the selected packet. It highlights the Ethernet II layer, showing the source and destination MAC addresses, and the protocol type (0x0800 for IPv4). The packet details pane also shows the Internet Protocol and Hypertext Transfer Protocol layers.

Middle pane: Encapsulation

And a lot of other stuff!

IP Packet

IP Source and Destination Addresses

Protocol Type

The middle pane of Wireshark shows the encapsulation details of the selected packet. It highlights the Internet Protocol layer, showing the source and destination IP addresses, and the protocol type (0x06 for TCP). The packet details pane also shows the Ethernet II and Hypertext Transfer Protocol layers.

Middle pane: Encapsulation

TCP Segment

Source and Destination Port Numbers

GET

HTTP Request

The middle pane of Wireshark shows the encapsulation details of the selected packet. It highlights the Transmission Control Protocol layer, showing the source and destination port numbers, and the GET method. The packet details pane also shows the Ethernet II, Internet Protocol, and Hypertext Transfer Protocol layers.
